NOTE Given the nature of EEMD, each time you decompose a signal, will obtain a different set of components. Since each EMD (S+Raado) is independent, this should considerably improve the speed of execution. Ext\_eemdmd (None: None) can be passed on the defined EMD object, which will be used to calculate the IMF decompositions in each attempt. This new approach uses the mother advantage of the white rifle's statistical characteristics to disturb the signal in its true solution of solution and cancel yourself after serving its proportion; Therefore, it represents a substantial improvement in relation to the original EMD and is a whole dwarf of data (nothing) truly assisted by Raado. It is relative to the absolute amplitude of the signal, this is,  $\hat{\sigma} = \sigma \cdot \max(s) \cdot \min(s) \cdot |v|$ , where  $\sigma$  is Raado widthth.
